Box Missing Parts
Assistant Commissioner for Patents
Washington, D.C. 20231

LETTER

The Applicant is due to respond to a Notice to File Missing Parts. (A copy is enclosed.) One of the Missing Parts is the enclosed Declaration document. It has been deemed defective, because it has been signed by one, but not the second named inventor.

The second inventor cannot be found. The Applicant has therefore petitioned the Commissioner (copy attached) to:

- * accept the enclosed Declaration document for the above captioned case, and
- * permit prosecution for the above captioned case to proceed, as if the enclosed Declaration document had been signed by also by the second inventor.

The late filing fee of \$130 under 37 C.F.R. §1.16(e) is also enclosed. Any deficiency or overpayment should be charged or credited to deposit account No. 13-1703.

If there are any questions, please call the undersigned.

Respectfully submitted,

MARGER JOHNSON & McCOLLOM, P.C.

Office of Petitions
Assistant Commissioner for Patents
Washington, D.C. 20231

PETITION UNDER 37 C.F.R. §1.47(b)

The Applicant is due to respond to a Notice to File Missing Parts. (A copy of the Notice is enclosed as Exhibit A.)

The enclosed Declaration document (copy attached as Exhibit B) is one of the Missing Parts. It has been deemed defective, because it has not been signed by one of the two inventors (the other inventor has signed).

Petition is hereby respectfully made to the Commissioner on behalf of the Applicant
to:

- * accept the enclosed Declaration document for the above captioned case, and
- * permit prosecution for the above captioned case to proceed, as if the enclosed Declaration document had been signed also by the second inventor.

This action by the Commissioner is necessary to preserve the patent rights of the assignee, Samsung Electronics Co.

This missing inventor has been diligently searched for, but can not be found. Enclosed is an Affidavit (Exhibit C) by US Patent Attorney Gregory T. Kavounas, accompanied with other documents (Exhibit D) evidencing efforts to locate the missing inventor. Last known addresses of both inventors are shown in the Affidavit.

NOTICE TO FILE MISSING PARTS OF NONPROVISIONAL APPLICATION

FILED UNDER 37 CFR 1.53(b)

Filing Date Granted

An application number and filing date have been accorded to this application. The item(s) indicated below, however, are missing. Applicant is given **TWO MONTHS** from the date of this Notice within which to file all required items and pay any fees required below to avoid abandonment. Extensions of time may be obtained by filing a petition accompanied by the extension fee under the provisions of 37 CFR 1.136(a).

- The statutory basic filing fee is missing.
Applicant must submit \$ 710 to complete the basic filing fee and/or file a small entity statement claiming such status (37 CFR 1.27).
- The oath or declaration is unsigned.
- To avoid abandonment, a late filing fee or oath or declaration surcharge as set forth in 37 CFR 1.16(e) of \$130 for a non-small entity, must be submitted with the missing items identified in this letter.
- **The balance due by applicant is \$ 840.**

*A copy of this notice **MUST** be returned with the reply.*

PATENT APPLICATION
Attorney Docket No. 9898-176

COMBINED DECLARATION AND POWER OF ATTORNEY
FOR PATENT APPLICATION

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled MEMORY DEVICE HAVING DEPTH COMPARE-WRITE FUNCTION AND METHOD FOR DEPTH COMPARE-WRITE USED BY THE MEMORY DEVICE, the specification of which is attached hereto:

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, Sec. 1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, Sec. 119 (a)-(d) or §365(b) of any foreign application(s) for patent or inventor's certificate, or §365(a) of any PCT international application which designated at least one country other than the United States of America, listed below and have also identified below any foreign application for patent or inventor's certificate, or of any PCT international application having a filing date before that of the application on which priority is claimed:

Prior Foreign Application(s)

00-37769
(Number)

Republic of Korea
(Country)

3 July 2000
(Day/Month/Year Filed)

Claiming
Priority?
☒ Yes ☐ No

I hereby claim the benefit under Title 35, United States Code, Sec. 119(e) of any United States provisional application listed below: NONE

I hereby claim the benefit under Title 35, United States Code, Sec. 120 or §365(c) of any PCT international application designating the United States of America listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, Sec. 112, I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, Sec. 1.56 which occurred between the filing date of the prior application and the national or PCT international filing date of this application: NONE

I hereby appoint the following attorneys to prosecute the application, to file a corresponding international application, to prosecute and transact all business in the Patent and Trademark Office connected therewith:

RECEIVED

OCT 16 2001

OFFICE OF PETITIONS

AFFIDAVIT
IN SUPPORT OF
PETITION MADE UNDER 37 C.F.R. §1.47(b)

By my signature at the end of this document, I hereby affirm the following:

1. My name is Gregory T. Kavounas; I am a patent attorney registered to practice in front of the United States Patent and Trademark Office ("PTO"); my PTO registration number is 37, 862; I work for the law firm of Marger, Johnson and McCollom ("MJM").
2. I and other attorneys from MJM are authorized to act in front of the PTO for patent matters on behalf of Samsung Electronics Co. ("Samsung"), a Korean company.
3. On July 2, 2001, one of the authorized attorneys of my law firm filed the above captioned patent application with the PTO on behalf of Samsung.
4. Samsung has a proprietary interest in the above captioned patent application. In particular, Samsung claims full ownership of all patent rights resulting from the patent application.

5. Samsung's claim of ownership is based on the fact that the patent application describes an invention made by two employees ("inventors") of Samsung, while in the employ of Samsung.
6. The two inventors are a) Mr. Dong-woo LEE and b) Mr. Ja-Il KOO.
7. The first one of the two inventors was available, and signed a Declaration Form, and an Assignment form. The last known address of this signing inventor is:
- Mr. Dong-woo LEE
106-902, Huyndae Apt.,
Namsuwon, Annyung-ri,
Tae-an-eub, Hwasung-gun,
Kyeonggi-do
Republic of Korea
8. The second one of the two inventors, namely Mr. Ja-Il KOO, has left the employ of Samsung, and can not be found. He has been unavailable for signing the Declaration Form. The last known address of this missing (nonsigning) inventor is:
- Mr. Ja-Il Koo
1-1104, Samhwan Apt.,
Garak-dong, Songpa-gu,
Seoul,
Republic of Korea
9. A Korean patent law firm named Y.P. Lee & Associates ("Y.P. Lee") sometimes acts as intermediary between MJM and Samsung.
10. MJM has received from Y.P. Lee a packet ("Exhibit D") documenting Samsung's search for the missing inventor.
11. Exhibit D includes a cover letter (mailed July 19, 2001) to Ms. Christina Lawton of MJM. While not an attorney, Ms. Lawton is erroneously addressed as "Esq.".

12. The cover letter documents Samsung's search for the missing inventor, which is the remainder of the Exhibit D.

13. I believe Exhibit B to be genuine.

14. I believe that Samsung's search for the missing inventor has been more than diligent under the circumstances, as documented by Exhibit D.

15. Being hereby warned that willful false statements and the like so made are punishable by fine or imprisonment, or both, under 18 U.S.C. 1001, and that such willful false statements may jeopardize the validity of the application or any resulting patent; I hereby declare and affirm that and all statements made of my own knowledge are true, and all statements made on information and belief are believed to be true.

Respectfully submitted,

Re: U.S. Patent Application ^{ET AL} corresponding to
Korean Patent Application No. 00-37769
Samsung Electronics Co., Ltd.

RECEIVED

OCT 16 2001

OFFICE OF PETITIONS

Dear Ms. Lawton:

This is further to our letter 29 June 2001 instruction you file the application without the Declaration and Assignment. Enclosed are materials proving that Mr. Ja-II Koo, the non-signing inventor, could not be found in spite of Samsung's diligent efforts.

Eun-Joung Uhm, a member of Samsung In- House Patent Team, sent by certified mail and contents-certified mail a copy of the Specification, Claims, Declaration and Assignment to the last known address of the non-signing inventor, Mr. Ja-II Koo, along with a letter requesting that he review the Application and sign and return the formal documents and Application. However, the formal documents were returned because Mr. Ja-II Koo could not be found at that address.

Also, Eun-Joung Uhm sent an e-mail via "SINGLE", which is the internal network of Samsung, to Young-Woo Nam, a manager of the personnel Department in Samsung Electronics Co., Ltd., and Dong-Woo Lee, the joint inventor. However, in their replies to Eun-Joung Uhm's e-mail letter, both of the above people stated that Mr. Koo's whereabouts is unknown.

Also, Eun-Joung Uhm performed a Phone search on the Yahoo internet web site to try and locate Mr. Koo's whereabouts, but her efforts proved to be unsuccessful. Further, she searched for possible variations of the name "Ja-II Koo" and contacted "Ja KOO" living in San

EXHIBIT D

Page 2

in San Jose by phone because most employees who have stopped working for Samsung are known to live in San Jose. However Uhm's efforts have proved to be unsuccessful.

Although Samsung has tried to contact him to obtain his signature in many ways, their efforts have proved to be unsuccessful.

Please provide us with information as to how we should proceed as well as the necessary documents. We look forward to hearing from you soon

We appreciate your cooperation in this case.

Sincerely yours,

Y.P. LEE & ASSOCIATES

Hello? I am Eun-Joung Uhm of Samsung In-House Patent Team.

I am looking for a contact point of a retired inventor to obtain a signature needed for filing an application in the U.S. If you know the contact point of Mr Ja-Il Koo who was a member of your department and quit the company on the end of September last year, please let me know. (Please reply by SINGLE.)

* Please reply if you do not know it.

Recipients:

manager of the personnel Department Samsung Electronics Co., Ltd.: Young- Woo Nam

Inventor's department: Dong-Woo Lee

UHM EUN JOUNG 

안녕하세요? 지적재산팀 엄은정입니다.
미국출원시 필요한 발명자 싸인을 받기 위해 퇴직한 발명자의 연락처를 찾고 있습니다.
퇴직 당시 조 과장님의 부서원이 었고 지난해 9월말에 퇴사한 "구자일" 씨의 연락처를 알고계시면
알려 주시면 고맙겠습니다.(SINGLE로 다시한번 보내주시면 감사하겠습니다.)

* 모르실경우라도 답장주시기 바랍니다.

수신인:

COMBINED DECLARATION AND POWER OF ATTORNEY
FOR PATENT APPLICATION

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled MEMORY DEVICE HAVING DEPTH COMPARE-WRITE FUNCTION AND METHOD FOR DEPTH COMPARE-WRITE USED BY THE MEMORY DEVICE, the specification of which is attached hereto:

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, Sec. 1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, Sec. 119 (a)-(d) or §365(b) of any foreign application(s) for patent or inventor's certificate, or §365(a) of any PCT international application which designated at least one country other than the United States of America, listed below and have also identified below any foreign application for patent or inventor's certificate, or of any PCT international application having a filing date before that of the application on which priority is claimed:

MEMORY DEVICE HAVING DEPTH COMPARE-WRITE FUNCTION AND METHOD FOR DEPTH COMPARE-WRITE USED BY THE MEMORY DEVICE

This application claims priority from Korean Priority Document No. 00-37769, filed
5 on July 3, 2000 with the Korean Industrial Property Office, which document is hereby
incorporated by reference.

BACKGROUND OF THE INVENTION

Field of the Invention

10 The present invention relates to memory devices, and more particularly, to memory
devices having a Z-buffering function and method for depth compare-write used by the
memory devices.

Description of the Related Art

15 In two-dimensional (2-D) graphics, an object on a display screen is represented by
coordinates X, Y and color. When an existing object is replaced with a new object on a
display screen, a color value is recorded at a position of a memory corresponding to
coordinates X, Y of each pixel forming the new object, and then the color value is scanned on
the display screen. By "object" it is meant a graphics object. The object may be called
20 "new" from the graphics processing, even though it may be the same screen object perceived
by the user.

In three-dimensional (3-D) graphics, Z-values represent a pixel's distance from the
viewer. Typically, small Z values indicate that an object is close to the viewer, whereas large
Z values indicate that the object is far away. In other words, Z-coordinate information
25 determines depth data of an object on a display screen, thus allowing the user to recognize the
depth of the object.

Devices that use 3-D graphics employ 3-D functions, which include Z-buffering, α -
blending, and texture mapping. Such functions are computation intensive, and thus require a
wide bandwidth. In particular, in Z-buffering, in order to perform 3-D graphic applications
30 such as a 3-D game, Z-coordinate information should be added to X- and Y-coordinate
information in a 2-D graphic. This serial operation is called Z-buffering.

In such functions, an existing object may be replaced by a new object on a display
screen. It may be the same object, but with a new appearance, as would be mandated by the
updated Z-coordinates.

Thus, when replacing an existing object with a new object on a display screen, firstly spatial coordinate values (also called Z values or depth data) of pixels are compared which map the existing object, against those which map the new object. Then, if the latter is less than the former, the former is updated with the latter.

5 Z-buffering is performed by comparing the Z-values of incoming color data with the Z-values of pre-existing color data. If the incoming color data is closer (i.e., it has a smaller Z value), the pre-existing color data is replaced with the incoming color data. Otherwise, the incoming color data is discarded.

10 In the prior art, this function is performed by the memory controllers. Such a memory controller reads the spatial coordinate values of the pixels of the existing object from a memory device, and compares them with the spatial coordinate values of the pixels of the new object. If there is any modification in the spatial coordinate values of the existing object, then the memory controller writes the spatial coordinate values of the new object to the memory device. This operation is called read-modify-write (hereinafter referred to as
15 "RMW").

FIG. 1 is a timing diagram for explaining RMW of a conventional memory device. Referring to FIG. 1, if a memory read command RD is input on the rising edge of a clock cycle 3 after an activate command ACT is input from a memory controller, internal depth data Dout stored in a memory cell selected by the read command RD is read by the memory
20 controller through data input/output (I/O) pins DQ.

The memory controller compares spatial coordinate values Dout of an existing object with input spatial coordinate values Din of a new object at intervals "a". As can be seen from Fig. 1, interval "a" is two cycles long. If the input spatial coordinate values (hereinafter referred to as "external depth data") Din of the new object are smaller than the spatial
25 coordinate values (hereinafter referred to as "internal depth data") Dout of the existing object. It means that the object is now closer. The memory controller then prepares for writing the external depth data Din to a memory cell array of the memory device by replacing the internal data. If there is a write command WR, then the external depth data Din standing-by in the data I/O pins DQ is written to the selected memory cell array of the memory device, in
30 response to the write command WR.

As can be seen in Fig. 1, for performing one RMW operation on spatial coordinate values, at least ten clock cycles are required from the point when the activate command ACT is input, until the point when a precharge command PRE may be input. This is because a

logic for comparing coordinate values of depth data is included in a memory controller, and a depth compare function is performed by the memory controller of the prior art.

Accordingly, the conventional memory device has a problem in that memory bus performance is degraded. The time taken for performing an RMW operation on spatial coordinate values is delayed, which degrades performance of the graphics functions.

SUMMARY OF THE INVENTION

To solve the above problems, it is a first objective of the present invention to provide a memory device which can shorten the time taken for modifying and writing spatial coordinate values, so as to improve the performance of a memory bus performing graphics.

It is a second objective to provide a method of processing depth data in a memory device for reducing the time needed to modify and write spatial coordinate values to improve graphics performance, as well as improving the performance of a memory bus.

Accordingly, to achieve the first objective, the present invention provides a memory device including a memory cell array, and a data modifying circuit for comparing external depth data of a new object received from the memory controller with internal depth data of an existing object. The internal depth data is stored in the memory cell array. The comparison is done between the data having representing coordinates of the new object and of the existing object. The internal depth data is replaced by the external depth data depending on the result of this comparison.

To achieve the second objective, the present invention provides a method of processing depth data of an object in a memory device controlled by a memory controller. The method includes the steps of: receiving external depth data of a new object from the memory controller, storing the received external depth data, comparing the stored external depth data with corresponding internal depth data stored in the memory device, and storing the external depth data with which the internal depth data is replaced depending on the result of the comparison in the step. A status signal may be outputted to the memory controller, indicating that the internal depth data has been modified.

BRIEF DESCRIPTION OF THE DRAWINGS

The above objectives and advantages of the present invention will become more apparent by describing in detail a preferred embodiment thereof with reference to the attached drawings in which:

FIG. 1 is a timing diagram for explaining a read-modify-write (RMW) operation of a memory device in the prior art;

FIG. 2 illustrates a memory system including a memory device having a depth compare function according to an embodiment of the present invention;

5 FIG. 3 illustrates a detailed circuit for the memory device of FIG. 2;

FIG. 4 is a timing diagram illustrating a compare-read function according to an embodiment of the present invention; and

FIG. 5 is a flowchart for illustrating a method of comparing and reading depth data of an object in a memory device controlled by a memory controller according to an embodiment
10 of the present invention.

DETAILED DESCRIPTION OF THE INVENTION

Referring to FIG. 2, a memory system includes a memory device 22 according to the present invention, and is controlled by a memory controller 21. A monitor is not shown.

15 Furthermore, FIG. 2 shows a flow of a command signal CMD, which is generated by the memory controller 21, and is transmitted to the memory device 22. Other signals are also sent through control pins DC0 and DC1 and a data I/O pin DQ. The memory controller 21 also generates an address, which selects a specific memory cell of the memory device 22.

Furthermore, the memory controller 21 generates and transmits to memory device 22
20 a first control signal CS1 and a second control signal CS2 through the control pins DC0 and DC1, respectively. Control signals CS1 and CS2 may be active or non-active (implemented by choosing high and low levels). The memory controller 21 also prepares for writing external depth data through the data I/O pin DQ.

The memory device 22 is controlled by the memory controller 21. The monitor
25 displays an object having depth data modified by the memory device 22. The memory controller 21 provides an interface for performing various controlling tasks of the monitor and of the memory device 22.

The memory device 22 generates and sends to the memory controller 21 a first status
30 signal SS1 and a second status signal SS2. If the first and second status signals SS1 and SS2 are in an active state (also called "HIT"), the memory controller 21 determines that internal depth data has been replaced by the external depth data. On the other hand, if the first and second status signals SS1 and SS2 are in an inactive state (also called "MISS"), the memory controller 21 determines that internal depth data is maintained.

In a preferred embodiment of the invention, the control signals CS1, CS2, travel through the same conductors as the status signals SS1, SS2, even though they travel in opposite directions. For example, status signal SS1 may be transmitted through first control pin DC0, and status signal SS2 may be transmitted through second control pin DC1.

5 This generates an advantageous economy in the construction of the invention. The economy is made possible by the fact that the control signals CS1, CS2, are generated and transmitted at different times than the status signals SS1, SS2, as will become clear from Fig. 4 later in this document.

10 Referring to FIG. 3, a detailed circuit of the memory device 22 of FIG. 2 is shown, which is made according to an embodiment of the present invention. The memory device 22 includes a data modifying circuit 30, a control circuit 31, a memory cell array 34, first and second control pins DC0 and DC1, and a data I/O pin DQ. In particular, the data modifying circuit 30 further includes a register 32 and a compare circuit 33.

15 The control circuit 31 receives external depth data of a new object through signal EDD being received from the data I/O pin DQ. Circuit 31 then outputs the external depth data EDD as either WTDC or NWT, in response to a first control signal CS1. If the first control signal CS1 is in a non-active state, the external depth data NWT is output to the memory cell array 34 for normal writing. This bypasses the remaining structure. On the other hand, if the first control signal CS1 is in an active state, the external depth data WTDC
20 is output to the register 32 for depth compare writing.

The register 32 stores the output signal WTDC of the control circuit 31, i.e., the external depth data. The compare circuit 33 compares the data of the coordinates of a new object, which is output as RS from the register 32, with internal depth data Fcomp of the corresponding coordinates of an existing object, the internal depth data being stored in the
25 memory cell array 34, in response to the second control signal CS2. If the output RS of the register 32, i.e., external depth data RS, is smaller than the internal depth data Fcomp, the compare circuit 33 outputs the external depth data RS to the memory cell array 34 in order to modify the internal depth data Fcomp. According to another embodiment of the invention, if the output RS of the register 32, i.e., external depth data RS, is larger than the internal depth
30 data Fcomp, the compare circuit 33 outputs the external depth data comp to the memory cell array 34.

The compare circuit 33 outputs at least one status signal to the memory controller 21. If the internal depth data Fcomp is modified as a result of this comparison, the status signal is

a logic "high" signal HIT1 or HIT2. But if the internal depth data Fcomp is not modified, the status signal is a logic "low" signal MISS1 or MISS2.

FIG. 4 is a timing diagram when performing a compare-record function of the memory device 22 of FIG. 3 according to the present invention. A depth compare-write operation of the memory device 22 is now described in detail with reference to FIGS. 3 and 4. Referring to FIGS. 3 and 4, a depth compare-write command signal WR, first and second control signals CS1 CS2, and external depth data Dw, all of which are generated by the memory controller 21, are input into corresponding pins, i.e., a command pin (not shown), the first and second pins DC0 and DC1, and the data I/O pin DQ. This happens on the rise of the third cycle.

The control circuit 31 is now described. If the first control signal CS1 is in an active state when the write command signal WR is in an active state, the control circuit 31 outputs incoming external depth data WTDC to the register 32, in order to accomplish a depth compare-write function. Thus, the incoming external depth data EDD and the output signal WTDC of the control circuit 31 are the same. However, if the first control signal CS1 is in a non-active state, the control circuit 31 outputs the incoming external depth data NWT to the memory cell array 34 for writing.

Furthermore, if the first control signal CS1 is in an active state, the second control signal CS2 becomes important. In this case, the compare circuit 33 compares the internal depth data Fcomp within the memory cell array 34 with the output of the register 32, i.e., the external depth data RS.

Control signal CS2 becomes important as follows. If CS2 is in a non-active state, the compare circuit 33 compares the internal depth data Fcomp with the output of the register 32 in units of X bits, for example, 16 bits, where X is a natural number. But if the second control signal CS2 is in an active state, the comparison is in units of NX bits, for example, 32 bits if N is 2 and X is 16 where N and X are natural numbers.

As a result of comparing, the compare circuit 33 will write to the memory cell array 34 one of the two sets. In one embodiment it will be the set with the smallest depth values, and in another embodiment it will be the set with the largest depth values. This writing over the previous values has the effect of modifying the relevant stored values, if the different data has been overwritten.

The compare circuit 33 also issues status signals SS1, SS2, for reporting to the controller 21 whether the data has been changed or not. The status signals SS1, SS2 may be sent after only three (best case) or four (worst case) clock cycles lapse after issuing a depth

compare-write command (which was performed in cycle 3). Accordingly, the whole process may be completed on the 6th or 7th cycle, as opposed to the 10 cycles needed by the prior art.

If the compare circuit 33 compares in units of X bits, and if the data has been modified, the first status signal SS1 is a logic "high" signal HIT1, indicating that the lower X bits of the internal depth data Fcomp have been modified through the first control pin DC0. Furthermore, the second status signal SS2 is logic "high" signal HIT2, indicating that the upper X bits of the internal depth data Fcomp have been modified through the second control pin DC1.

If the compare circuit 33 compares in units of NX bits, and if the data has been modified, the first status signal SS1 is a logic "high" signal HIT1, indicating that lower NX bits of the internal Fcomp have been modified. But if the depth data has not been modified, the first and second status signals SS1, SS2 are logic "low" signals MISS1 and MISS2, indicating that the internal depth data Fcomp is maintained.

FIG. 5 is a flowchart showing a method of processing depth data of an object in the memory device 22 controlled by the memory controller 21, which starts from step 501. Referring also to FIGS. 2 and 3, in a step 503, the memory device 22 receives the external depth data EDD.

In step 505, the memory device 22 receives a first control signal CS1, and determines its state. If the first control signal CS1 is in a ^{inactive} non-active state, then according to step 521, the control circuit 31 outputs the input external depth data EDD as data NWT to the memory cell array 34 within the memory device 22 for writing. But if the first control signal CS1 is in an active state, the control circuit 31 outputs external depth data EDD as data WTDC to the register 32.

In step 507, the memory device 22 receives a second control signal CS2, and determines its state. If the second control signal CS2 is in an active state, the compare circuit 33 compares the internal depth data Fcomp with the external depth data RS stored in the register 32 in units of NX bits (step 509). But if the second control signal CS2 is in an active state, the compare circuit 33 compares the internal depth data Fcomp with the external depth data RS in units of X bits (step 511).

In both instances, it is inquired whether the external depth data RS is smaller than the internal depth data Fcomp (step 513). If yes, the internal depth data Fcomp is modified to the external depth data RS (step 515). If not, the internal depth data Fcomp is maintained (step 517), and the external depth data RS is discarded. (In the equivalent embodiment, step 513 is

the opposite, inquiring instead whether the external depth data RS is larger than the internal depth data Fcomp.)

According to a next step 519, the result of the comparison is output to the controller, and the process ends (step 523). The result of the comparison is expressed via status signals
5 SS1, SS2. These can acquire values as described above. Logic "high" and "low" values may equivalently be chosen.

As has been described in the foregoing, according to the conventional art, at least ten clock cycles are required for one read-modify-write ("RMW") operation. However, according to the present invention, only six (6) or seven (7) clock cycles are sufficient for performing
10 one RMW operation, instead of the ten (10) required in the prior art. Therefore, the invention can improve performance by more than 30% compared with the prior art.

While this invention has been particularly shown and described with reference to preferred embodiments thereof, the illustrated embodiments are only examples, and it will be understood by those skilled in the art that various changes in form and details may be made
15 therein without departing from the spirit and scope of the invention as defined by the appended claims.

CLAIMS

What is claimed is:

1. A memory device for use with a memory controller, the memory device comprising:
5 a memory cell array adapted to store internal depth data of an object; and
a data modifying circuit distinct from the memory controller, the data modifying
circuit being adapted to
receive corresponding new external depth data of the object from the memory
controller,
10 compare the new external depth data with the internal depth data, and
write the external depth data in the memory cell array over the internal depth data
depending on the result of the comparison.
2. The memory device of claim 1, wherein
15 the data modifying circuit is further adapted to output to the memory controller a
status signal.
3. The memory device of claim 1, further comprising:
a first control pin for receiving a first control signal from the memory controller; and
20 a control circuit for transmitting the external depth data to the memory cell array
thereby bypassing the data modifying circuit depending on a state of the first control signal.
4. The memory device of claim 3, wherein
the data modifying circuit is further adapted to output to the memory controller a
25 status signal.
5. The memory device of claim 4, wherein
the status signal is output through the first control pin.
- 30 6. The memory device of claim 1, wherein the data modifying circuit includes
a register for storing the received new external depth data; and
a compare circuit for comparing the stored new external depth data with the internal
depth data and for writing the external depth data in the memory cell array depending on the
result of the comparison.

26

7. The memory device of claim 6, wherein
the compare circuit is further adapted to write the external depth data in the memory
cell array if the external depth data is smaller than the internal depth data.

5

8. The memory device of claim 6, wherein
the compare circuit is further adapted to output a status signal to the memory
controller.

10 9. The memory device of claim 6, further comprising:
a second control pin for receiving a second control signal from the memory controller,
wherein the compare circuit compares the internal depth data with the stored external
depth data in units of X bits when the second control signal is in a non-active state, and in
units of NX bits when the second control signal is in an active state.

15

10. The memory device of claim 9, wherein
if the second control pin is in an inactive state, the compare circuit outputs to the
memory controller:

20 a first status signal indicating that the lower X bits of the internal depth data have
been modified, and
a second status signal indicating that the upper X bits of the internal depth data have
been modified.

11. The memory device of claim 9, wherein
25 if the second control pin is in a non-active state, the compare circuit outputs to the
memory controller a status signal indicating that NX bits of the internal depth data have been
modified.

12. A method of processing depth data of an object in a memory device controlled by a
30 memory controller, the method comprising the steps of:

- (a) receiving external depth data of the object from the memory controller;
- (b) storing the received external depth data;
- (c) receiving a first control signal from the memory controller through a first control pin
distinct from the memory controller;

- (d) determining a state of the first control signal; and
- (e) if the state of the first control signal is determined to be inactive, writing the external depth data to a memory cell array within the memory device,
- (f) elseif the state of the first control signal is determined to be active, comparing the
5 stored external depth data with corresponding internal depth data stored in the memory cell array, and writing the external depth data over the corresponding internal depth data in the memory cell array depending on the result of the comparison.
13. The method of claim 12, wherein
- 10 step (f) further includes outputting to the memory controller a status signal indicating that the internal depth data has been modified.
14. The method of claim 12, wherein
- 15 writing in step (f) takes place if the comparison yields that the external depth data is smaller than the internal depth data.
15. The method of claim 12, wherein
- 20 writing in step (f) takes place if the comparison yields that the external depth data is larger than the internal depth data.
16. The method of claim 12, further comprising:
- (g) receiving a second control signal from the memory controller through a second control pin distinct from the memory controller,
- (h) determining a state of the second control signal; and
- 25 (i) if the state of the second control signal is determined to be inactive, comparing the internal depth data with the stored external depth data in units of X bits,
- (j) elseif the state of the second control signal is determined to be active, comparing the internal depth data with the stored external depth data in units of NX bits.
- 30 17. The method of claim 16, wherein step (i) further includes
- outputting to the memory controller a first status signal indicating that the lower X bits of the internal depth data have been modified, and
- outputting to the memory controller a second status signal indicating that the upper X bits of the internal depth data have been modified ~~through the second control pin.~~

18. The method of claim 17, wherein
the first status signal is output through the first control pin, and
the second status signal is output through the second control pin.

5

19. The method of claim 16, wherein step (j) further includes
outputting to the memory controller a status signal indicating that the NX bits of the
internal depth data has been modified.

10 20. The method of claim 19, wherein
the status signal is output through one of the first and second control pins.

ABSTRACT OF THE DISCLOSURE

A memory device for performing graphics functions, and a method of processing depth data that is received by a memory controller. The memory device includes a memory cell array, and a data modifying circuit. The data modifying circuit includes a register for storing external depth data received from the memory controller. The data modifying circuit also includes a compare circuit which compares the stored external depth data with corresponding internal depth data stored in the memory cell array, and updates the memory cell array accordingly. The compare circuit also outputs status signals, thus reporting to the memory controller whether the data was updated or not. Depending on a first control signal, a control circuit helps the external data be written directly to the memory, bypassing the data modifying circuit. Depending on a second control signal, the comparison is in X bits or NX bits.
